# 1. Technologies Used

With advances in healthcare informatics, one can provide better means to process patient records and therefore speed up the treatment, which in turn reduces the overall cost. Many tools exist for facilitating patient record processing: from assisting data entry to manipulating records, from generating output in required form to transferring it to other physicians for further examination, or to save it digitally for future use.

## 1.1 UI Design

Wireframes are used to design the secure hospital system functionality. A wireframe is a two-dimensional depiction of a page's interface that focuses on content priority and space allocation, as well as available features and planned behaviours. Because of this, wireframes rarely incorporate any styling, colour, or images.

Angular has a well-designed framework that makes it simple to use. It was created to enable working with web apps easier using the MVC architecture. It separates the model from the view and manages any data binding issues. Angular also includes two-way data binding, which means that when data in the model changes, the view is instantly updated, and vice versa. Angular was built with efficiency in mind. It is quick and efficient, making it an excellent choice for high-traffic websites. As a result, it is an excellent choice for public-facing websites.

## 1.2 Application Design

The framework used for backend development of the application is 'spring boot' (Java). Spring boot provides reliable performance with security for the application. JWT authentication is currently used for sign-up/sign-in for different user roles. The application uses the JDBC template for interaction with the database. Amazon SQS is used for interaction with the blockchain.

We employ a semi-supervised ML approach to group together malicious IPs. For each IP, we use the labels we must find features that are helpful in separating the good IPs from the bad ones. Another example of machine learning in this project is chatbot. Amazon Lex follows the basic chatbot architecture adhered to by all the big cloud based Conversational AI providers.

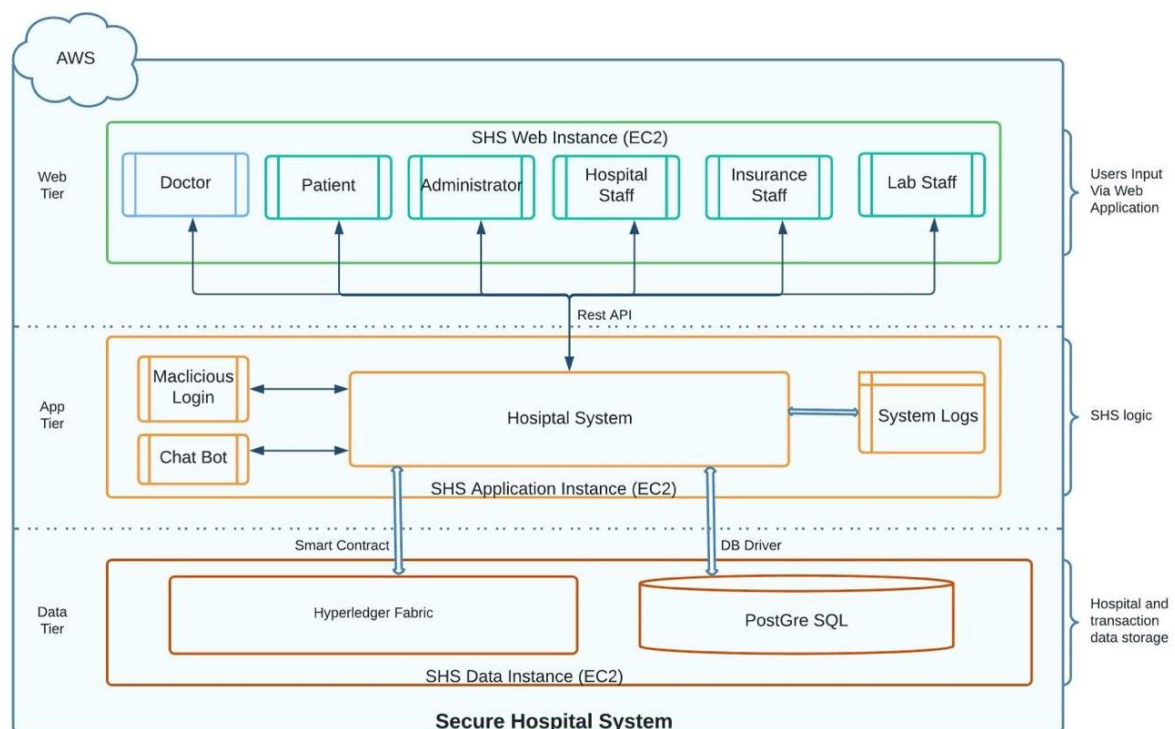

## 1.3 Database Design

The various transaction and user data are captured through the data in the Database. The relation between tables can be seen in the ER diagram below. Here, PostgreSQL will be

hosted in an AWS EC2 instance, with the access from the application for data processing. Hyperledger Fabric used as a solution to overcome the problems of traditional records management in hospital/medical system such as accessibility, security, and transaction/approval records.

## 2. What's new feature

SHS can be divided into a 3-tier architecture, involving web, app, and data tier. All tiers will be hosted on AWS. The app tier components developed in spring boot and services are up 24/7. The data tier has two components for storing the hospital data. Postgre SQL for storing the hospital data and Hyperledger blockchain to capture the approved transaction details.

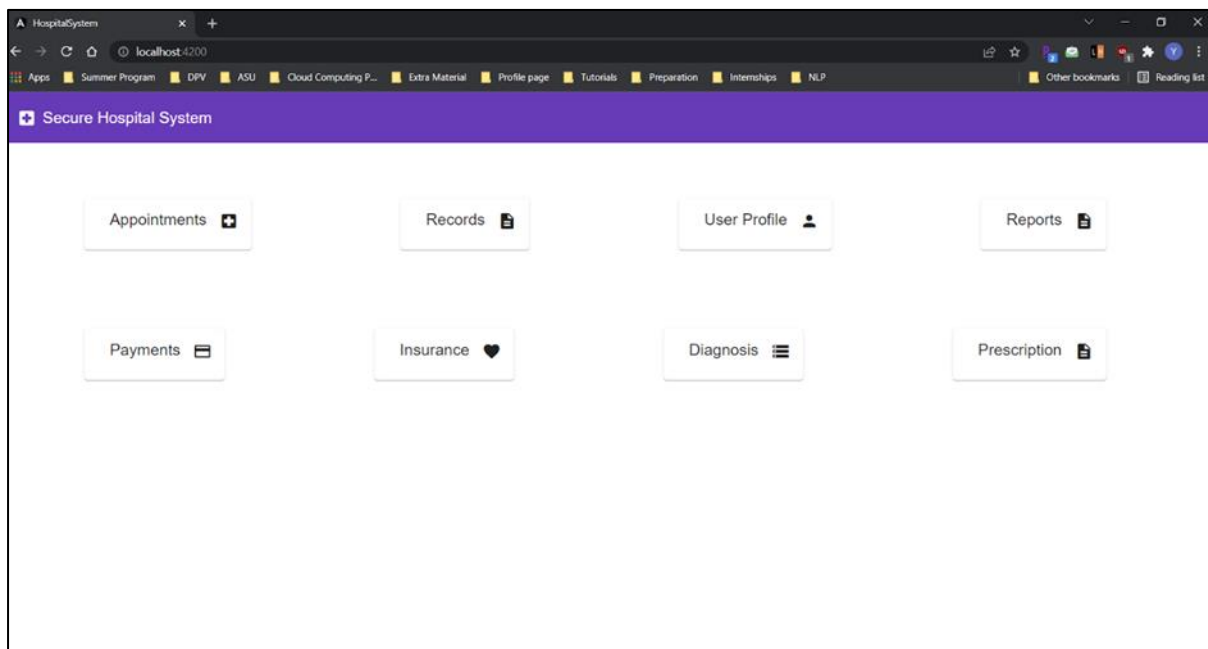

**Fig. Secure Hospital System Architecture**

The Web application are hosted as website. Web pages are designed using angular, as it is highly preferable as a robust frontend tool supplying components that assist people to write easy-to-use, readable, and maintainable code. Angular has built-in support to help prevent two common HTTP vulnerabilities, cross-site request forgery (CSRF or XSRF) and cross-site

script inclusion (XSSI). Both must be mitigated primarily on the server-side, but Angular provides helpers to make integration on the client-side easier.

Wireframe designs for the secure hospital functionality are provided below as a reference:

**Fig. Wireframe Design - Dashboard**

A security group acts as a virtual firewall for SHS EC2 instances to control incoming and outgoing traffic. Inbound rules control the incoming traffic to your instance, and outbound rules control the outgoing traffic from your instance. When component launched as an instance, you can specify same security groups. All components access across tier will be through secure protocol such as HTTPS. The secure hospital system will use a certificate for the web application for accessing webpages. A key pair, consisting of a public key and a private key, is a set of security credentials that you use to prove your identity when connecting to an Amazon EC2 instance. Amazon EC2 stores the public key on your instance, and you store the private key.

Blockchain technology is based on the principle of providing an individual control over their data and information, and hence potentially appropriate as part of a solution to patient ownership of their health data. Blockchain can create a decentralized identification that allows health care providers and patients to interact with one another directly without the need for an intermediary. The immutable audit trail which allows all changes of personal information to be tracked and traced. The increased security of patient's medical information. Not only is the data stored in multiple nodes across the distributed ledger; but it can also be encrypted with

the only key being in the hands of the patient. Due to limited functionality the feature of key with patient will be considered as future work. Blockchain applications may, therefore, provide solutions to the current problems of interoperability of medical records, incomplete patient data at the point of service, integrate insurance claim, and lack of access to personal records while ensuring security.

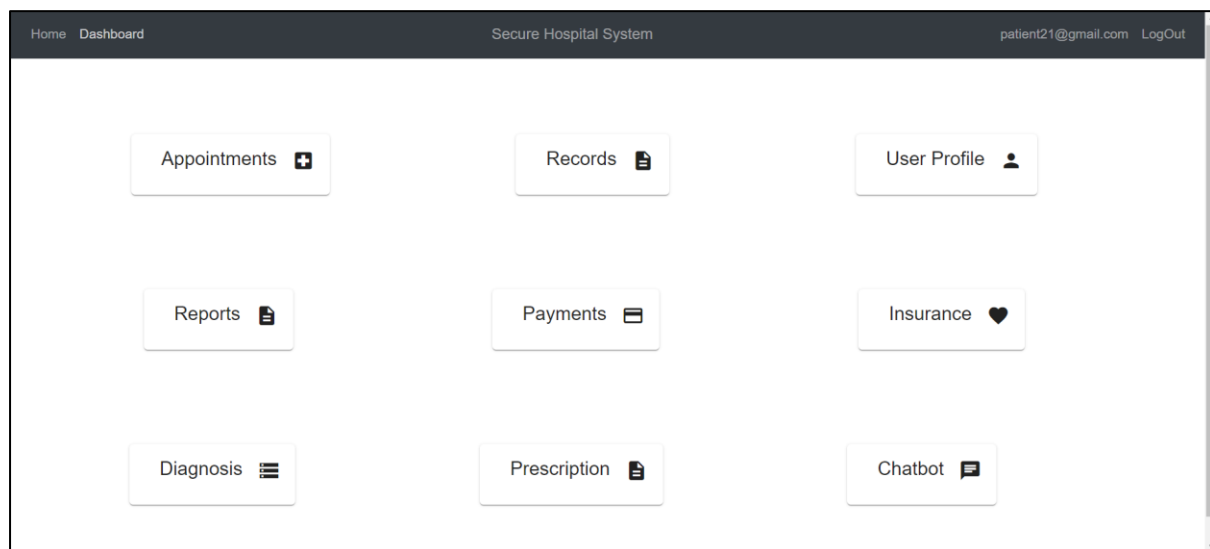

### 3. Workflow by User Operation

For accessing secure hospital system, user has to sign-up with relevant role. Login to the SHS using login authentication and two-factor authentication. Following subsection describes the functionality and navigation for various user roles.

#### 2.1 User: Patient

Login to the SHS webpage with the user role as patient. Below is the functionality and navigation through the patient user.

1. After logging in the patient can see the following dashboard for the patient along with patient name on the top:

2. Now, by clicking on the appointments tab the patient can book the appointment with the doctor and the next page demonstrates how we can book an appointment with the doctor

Home Dashboard Secure Hospital System patient\_1 Logout

### Appointments

Create Appointment View Appointment

Doctors:

- Doctor 2
- Doctor 4
- General
- Doctor 1

- Once the patient selects the doctor, we display all the available time and slots for the given patient. After which the patient can click on Submit to book an appointment. Once it's completed it gets a message saying appointment booked.

Home Dashboard Secure Hospital System patient\_1 Logout

### Appointments

Create Appointment View Appointment

Doctors: Select Doctor 2

Pick Your date: ☐ 03-31-2022 ☒ 04-01-2022 ☐ 04-02-2022 ☐ 04-03-2022 ☐ 04-04-2022 ☐ 04-05-2022 ☐ 04-06-2022

Pick Your time: ☐ 08:00:00-07 ☒ 09:00:00-07 ☐ 10:00:00-07 ☐ 11:00:00-07 ☐ 12:00:00-07 ☐ 13:00:00-07 ☐ 14:00:00-07 ☐ 15:00:00-07

Submit

Appointment Booked

- Also, after booking the appointment with doctor you can view your booked appointment on this page along with the status of your booked appointment by clicking on View appointment. Here the patient can also delete the booked appointment. Once the hospital staff approves the appointment the status changes and gets updated.

## 2.3 User: Hospital Staff

Login to the SHS webpage with the user role as hospital staff. Below is the functionality and navigation through the hospital staff user.

1. After logging in the hospital staff can see the following dashboard:

- Now, by clicking on the appointments tab, hospital staff can review the appointments that were booked by the patients and approve them depending upon the priority and availability of the doctor.

- Now, we have a records section which requires the patient id to check or add information of a patient.

- After the patient id is given, the hospital staff will have the option to add and update the patient details. They have the option to view the diagnosis, prescription and record details and the hospital staff will have the option to add the record details. All of the above 3 features have the same webpage to make the required changes.

## 2.4 User: Insurance Staff

The insurance staff has the privileges to manage the Insurance Claims of the patients and also add individual Insurance Policies to any of the required patients. Insurance staff has the access to view, review and validate claim requests received from the patients. They can create new insurance policies and insurance records of patients whenever necessary. They have the power to review the insurance claims and approve/deny any insurance claim.

1. Once logged in as an Insurance Staff member, the staff member has his individual Staff bar in the dashboard, where he can perform all of his activities related to Insurance Claims and Policies.

2. Once he selects the Insurance Staff Bar, they get to choose from the list of tasks they want to perform, such as reviewing new Claims, and also the ability to create new insurance policies.

Under the New Insurances section, they will have all the list of Insurance Claims that have been requested by various patients. The staff will be able to review and verify the Claims requested by the patients. If the staff chooses to deny the request of a particular claim, they can just click on the corresponding 'X' remove it from the list.

Enter the amount to be approved for the claim

100

Approve

- On approval of insurance claims, it will be moved to the Past Approved Insurances, where they will be able to access the record of all the approved insurance claims. Once the insurance staff approves/denies an insurance request, it gets reflected in the patient profile as well, so that the patient will be able to view the status of their insurance claims.

## 2.5 User: Lab Staff

Login to the SHS webpage with the user role as lab staff. Below is the functionality and navigation through the lab staff user.

1. After logging in as a lab staff, this is the dashboard the lab staff will have access to:

Home Dashboard Secure Hospital System lab07@gmail.com LogOut

Lab Requests Reports Diagnosis

2. After going into the lab requests, we can see all the pending lab requests that were requested by the doctor. Now, the lab staff will have the option to approve those requests they get from the doctors for patients.

8	134	04-03-2022	doctor123	Complete Blood Count	completed	04-03-2022	looks good	130	 	

- In the action bar of the report, we have three sections which is status, date and the record which can be edited by the lab staff whenever possible.

The screenshot shows the 'Reports' section of the 'Secure Hospital System'. A table lists patient reports with columns: No., Patient, Date Recommended, Requested, Test Name, Status, Date Completed, Record, Created By, Action, and Download. A modal form is open over the table, allowing updates to a specific report. The modal contains fields for Status (set to 'completed'), Date Completed (set to '3/28/2022'), and Record (set to 'Negative'). 'Save' and 'Cancel' buttons are at the bottom of the modal.

No.	Patient	Date Recommended	Requested	Test Name	Status	Date Completed	Record	Created By	Action	Download
1	2	03-10-2022	doctor3	COVID	Negative			7		
2	46	03-28-2022	doctor1@gmail.com	Diabet	completed		Everything looks fine	96		
3	46	03-01-2022	doctor1@gmail.com	Liver			Pikinav thi1	96		
4	46	04-03-2022	doctor1@gmail.com	Liver			All good :)	96		
5	46	03-08-2022	doctor1@gmail.com	Urinaly			testing	96		
6	46	03-30-2022	doctor1@gmail.com	Urinaly			test1234	96		
7	133	04-03-2022	doctor123	Compi			looks good	130		
8	134	04-03-2022	doctor123	Compi			looks good	130		

- Another functionality of the lab staff is diagnosis, where the lab staff has the option to view the patient diagnosis. After, clicking the diagnosis tab in the dashboard we will be asked for a patient id.

The screenshot shows the 'Diagnosis' section of the 'Secure Hospital System'. It features a simple form with a label 'Enter Patient Id:' followed by a text input field and a 'Submit' button.

- After entering the patient id, the diagnosis data of the patient given by the doctor is available for the lab staff for viewing.

6. The admin can access patient profiles and update each of their prescriptions, diagnosis, and records by providing the patient's id

Enter Patient Id:

## 7. System Logs: Admin can access and view the system log files.

The screenshot displays the SHS interface with the following components:

- Patients Info:** A form for entering patient details. Fields include Name (patient\_1), Age (40), Gender (Male), Address (1718 S. Jendly Ln), and a section for Card Care (2132142342342997) and Phone Number (0000000000).
- Diagnosis Details:** A table listing diagnoses for patient\_1.
 

No.	Date	Diagnosis	Doctor
1	03-08-2022	132312	doctor1
2	03-29-2022	Covid	doctor1
3	03-28-2022	Testing	doctor1@gma
4	03-30-2022	1223123	doctor1@gma
5	03-01-2022	23423423	doctor1@gma
6	04-03-2022	Liver Failure	doctor1@gma
7	03-31-2022	DGFG	doctor1@gma
- System Logs:** A terminal window showing a REST client request to `http://secure-management-system.v1-website-us-east-1.amazonaws.com/patients/404` (Not Found). The response is a 404 status with a message: "The dialing was closed".

## 4. Security Workflow

### 4.1 Login to SHS

Login page to for the secure hospital system.

Login

Email Id

Password

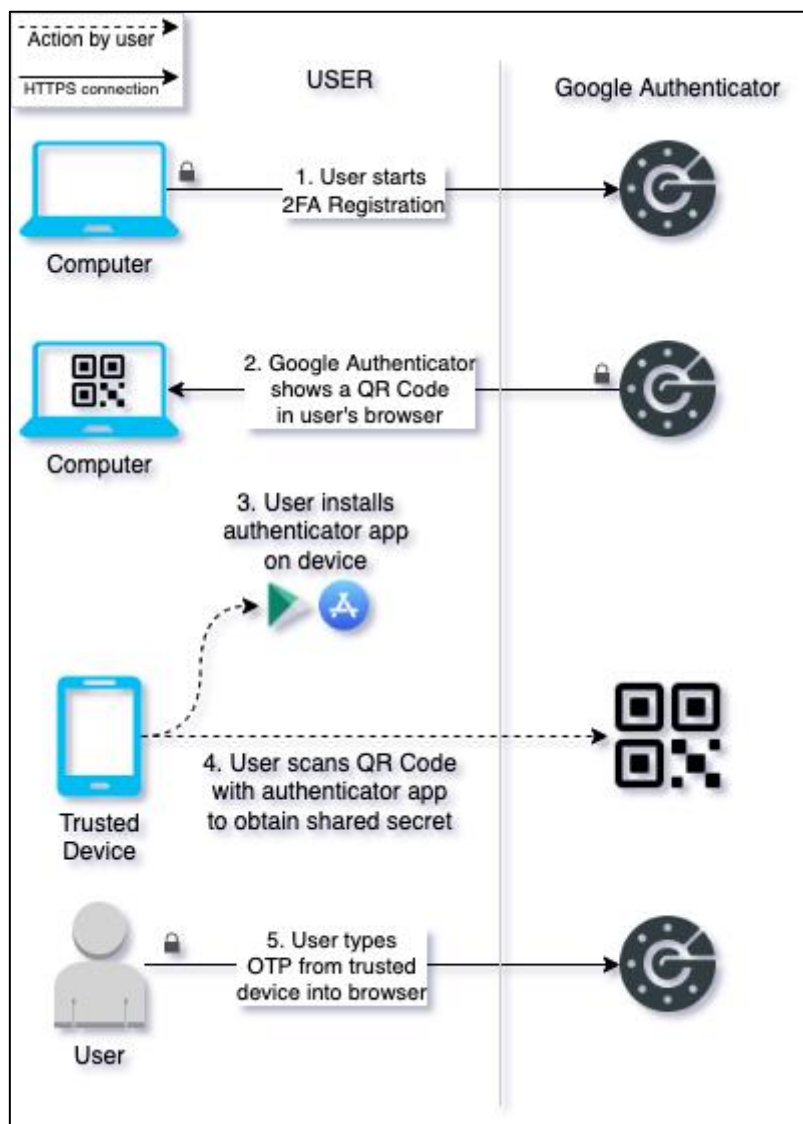

☐ I'm not a robot
 

reCAPTCHA  
Privacy - Terms

<div style="text-align: center;"> <p>2-Step Verification</p>  <p>Enter the Verification code generated by your Google Authenticator Application</p> <input type="text"/> <p>Submit</p> </div>	
--	--

Below diagram describes the process flow of the user login authentication.

## 4.2 Setup 2FA

Setup the 2 Factor Authentication using Google Authenticator for secure Login.

1. Install the Authenticator app by Google from the Play Store (Android) or from the AppStore (IOS).
2. We need to link the Website Login with the Google Authenticator during registration.
3. On the Registration page, once the user enters the details and clicks the Sign-Up Button, a unique QR code will be generated which is used to link the user with the Google Authenticator

### Setup TFA

Scan the QR code in the Google Authenticator

Auth Type - Time Based - OTP

Submit

Note\*: This is a onetime generated QR Code, please make sure to scan it.

4. Now, scan the QR code using the Google Authenticator app. On scanning, the app starts to generate the new code every 30 seconds.

5. Enter the code within the timeframe into the website to initiate a secure login.
